~~Intraoperative abdominal ultrasound in oncologic imaging~~

Intraoperative ultrasound (IOUS) is a dynamic imaging modality that provides interactive and timely information during surgical procedures. Because the transducer is in direct contact with the organ being examined, high-resolution images can be obtained that are not degraded by air, bone, or overlying soft tissues.

~~Abdominal Intraoperative Ultrasonography~~

BACKGROUND: Ultrasonography during abdominal surgery has been reported since the 1960s, but its use did not become widespread until the recent availability of high-frequency, high-resolution transducers. This review discusses the application of intraoperative ultrasonography to open and laparoscopic abdominal surgery.

Intraoperative ultrasound has become an indispensable part of abdominal surgery. It is a critical tool to evaluate and manage hepatic, biliary, and pancreatic diseases. IOUS has the advantage of being the only real-time, intraoperative imaging technique available in the operating room.

~~The role of intraoperative ultrasonography in the ...~~

Intraoperative ultrasound may also be useful to characterize non-IPMN cyst anatomy or assist in obtaining aspirates for diagnosis [25, 26]. However, as most of this can now be done via EUS preoperatively, the role of IOUS is to delineate anatomy for resection.
