Computer System Architecture is an introductory book for learning how to design computer hardware. The book has been written for people who may not have any prior knowledge of computer hardware. However, one is required to be aware of assembly language programming with a microcomputer.

In computer engineering, microarchitecture, also called computer organization and sometimes abbreviated as *µarch* or *uarch*, is the way a given instruction set architecture is implemented in a particular processor. A given ISA may be implemented with different microarchitectures; implementations may vary due to different goals of a given design or due to shifts in technology. Computer architecture is the combination of microarchitecture and instruction set architecture.

What is Computer Architecture and Organization? In general terms, the architecture of a computer system can be considered as a catalogue of tools or attributes that are visible to the user such as instruction sets, number of bits used for data, addressing techniques, etc. Whereas, Organization of a computer system defines the way system is structured so that all those catalogued tools can be used. The significant components of Computer organization are ALU, CPU, memory and memory ...

Computer Organization tells us how exactly all the units in the system are arranged and interconnected. A programmer can view architecture in terms of instructions, addressing modes and registers. Whereas Organization expresses the realization of architecture. While designing a computer system architecture is considered first. An organization is done on the basis of architecture. Computer Architecture deals with high-level design issues. Computer Organization deals with low-level design issues.
