Thermal conduction. Thermal conduction is the transfer of heat (internal energy) by microscopic collisions of particles and movement of electrons within a body. The microscopically colliding objects, that include molecules, atoms, and electrons, transfer disorganized microscopic kinetic and potential energy, jointly known as internal energy.

Introduces engineering heat transfer, based on the development of an inductive approach to the formulation and solution of applied problems. Emphasis is on problem formulation. Coverage progresses from foundations of heat transfer through different types of conduction and convection, heat exchangers, foundations and different types of radiation, and phase exchange.

Then the heat transfer to the inside fluid and to the surroundings becomes approximately proportional to the in-side and outside heat transfer coefficients, respectively. If, for example,  $h_i \ll h_o$ , the heat transfer to the surroundings may be neglected compared with that to the inside fluid.
