In simple words, good conductors of electricity (such as copper) are called as conductors and non-conductors (such as paper) are called as insulators. There are some materials, which are not good conductors of electricity neither good insulators, such materials are called as semiconductors.

Superconductivity is the set of physical properties observed in certain materials, wherein electrical resistance vanishes and from which magnetic flux fields are expelled. Any material exhibiting these properties is a superconductor. Unlike an ordinary metallic conductor, whose resistance decreases gradually as its temperature is lowered even down to near absolute zero, a superconductor has a characteristic critical temperature below which the resistance drops abruptly to zero. An electric curre

Semiconductors are those materials which are neither good conductors nor good insulators. Their conductivity is intermediate between conductors and insulators. Silicon and germanium are semiconductor elements, at room temperature. The conducting of semiconductors is charged by temperature applied voltage or incident light. Pure silicon or germanium are poor conductors but by doping with impurities charge the conductivity a lot. The temperature coefficient of resistivity is negative for ...
