drives also include frequency outputs for speed reference. A drive's analog input typically accepts a speed command from a PLC or remote potentiometer. These analog signals are typically 0 to 10 volts DC, 4 to 20 milliamps or something similar. The drive's analog output, where available, also has the same signal levels.

Similarly, constant-torque applications, such as conveyors, extruders, and hoists, should use constant-torque V/f patterns. Constant-torque applications need full magnetizing current at all speeds.

In these applications, the main drive must start and stop the positioning conveyor with moderate to high precision. While DC and AC motors are popularly used to maintain velocity control for fixed or constant speed conveyor applications, step and servo motors offer more precise positioning capabilities for conveyors requiring more exact precision

Using our medium and low voltage drives to control your conveyor motors helps you get longer life out of the conveyor system. Our variable speed drives control and prevent the belts slipping and stretching, and that helps keep the belts lasting longer. Our drives also offer regenerative braking options for downhill conveyors that can put
