Datastructures and algorithms are essential to computer science, which is the study of data, its representation in memory, and its transformation from one form to another. In programming, we use datastructures to store and organize data, and we use algorithms to manipulate the data in those structures.

This is a highly technical text on the topic of data structures and algorithmic design. Data structures as used within the text are the encapsulation of data variables into a data object: coming from a C background, think of them as a "struct". Unlike C though, C++ encapsulates the methods or functions that are used to manipulate the data variables as well. Simply put, an algorithm is the recipe for manipulating the data in an object.
