Discrete-time control systems differ from continuous-time control systems in that signals for a discrete-time control system are in sampled-data form or in digital form. If a digital computer is involved in a control system as a digital controller, any sampled data must be converted into digital data.

'Signals and systems' is the study of systems and their interaction. This book studies only discrete-time systems, where time jumps rather than changes continuously. This restriction is not as severe as it seems. First, digital computers are, by design, discrete-time devices, so discrete-time signals and systems includes digital computers.

Lecture: Discrete-time linear systems Stability of discrete-time linear systems. Stability of first-order linear systems. Consider the first-order linear system. $x(k+1) = ax(k)+bu(k)$ $x_r = 0, u_r = 0$ is an equilibrium pair For $u(k) = 0, k = 0, 1, \dots$, the solution is.

The time response of a discrete-time linear system is the solution of the difference equation governing the system. For the linear time-invariant (LTI) case, the response due to the initial conditions and the response due to the input can be obtained separately and then added to obtain the overall response of the system.

Now we can rewrite our continuous time system eqn. 1 in discrete time as: $x((k+1)T) = G(T)x(kT) + H(T)u(kT)$ (6) and $y(kT) = Cx(kT) + Du(kT)$: (7) It is worthwhile to convince yourself that this is the exact solution for $x(t)$ when $t = kT$.
