DOUBLY FED INDUCTION MACHINE

Abstract: The brushless doubly fed induction machine (DFIM), without brushes and slip rings, is regarded as an attractive alternative to the conventional DFIM in terms of reliability. This paper presents a sensorless field-oriented control strategy for

to the development of models for wind turbines employing doubly-fed induction generators. For a period of more than 10 years starting from the early 2000s, a significant evolution has been observed in the approach to modeling this type of electrical machine. While the machines for pumped storage units will be much larger

driven synchronous generator (without gearbox) or a doubly-fed induction generator (DFIG). Fixed-speed induction generators with stall control are regarded as unfeasible [3] for these large wind turbines. Today, doubly-fed induction generators are commonly used by the wind turbine industry (year 2005) for larger wind turbines [19, 29, 73, 105].

connected to equipment outside the machine.. By feeding adjustable frequency AC power to the field windings, the magnetic field can be made to rotate, allowing variation in motor or generator speed.

Doubly Fed Induction Machine Modeling

Doubly Fed Induction Machine offers clear mathematical descriptions of basic dynamic DFIM models as well as a detailed steady-state analysis. The authors provide a more sophisticated model of a DFIM that takes into account grid disturbances such as voltage dips and balance disruptions. The second part of the book surveys DFIM control strategies.

Induction Machine - an overview | ScienceDirect Topics

This chapter focuses on the dynamic modeling of induction machines. Two types of induction machine models are presented: space vector-based model and complex vector-based model. Type-3 wind generator, or doubly-fed induction generator, is an induction generator with rotor side connected to a converter.
