This is the second in a four-part blog series on designing a SAP on Azure Architecture. In the first part of our blog series we have covered the topic of designing for security.Robust SAP on Azure Architectures are built on the pillars of security, performance and scalability, availability and recoverability, and efficiency and operations.

Scalability often is discussed at the application layer, highlighting capability of a system, network or process to handle a growing amount of work, or its potential to be enlarged in order to accommodate that growth. While scalability can rely on elasticity, it can also be achieved with over provisioning. There are two types of scalability:

Topological architecture is the combined design of networks, systems, platforms, and storage architectures. Some call this area physical architecture ; however, I personally feel that the term topological infers topology, and WebSphere performance scalability is very much about topology selection.

Maximizing FileMaker WebDirect Performance and Scalability. FileMaker WebDirect made it possible - most of the time - to log in to a database from a web browser and just have it work. Which is really an incredible thing when you think about it. And by the way, it's not recommended for production databases without some fine tuning and testing.

Cost, security, performance, availability, and reliability are some common key areas to consider. Another criterion that has been added to the list recently is cloud scalability and cloud elasticity. Many have used these terms interchangeably but there are distinct differences between scalability and elasticity.
