Electric Power Math Worksheet Answers 1. There are 2 A of current in a circuit that has one 1.5 V battery. What is the electric power consumed by the circuit? $1.5\text{ V} \cdot 2\text{ A} = 3\text{ VA} = 3\text{ W}$ Use the equation: $P = I \times V$ $P =$ electric power consumed by the circuit (Watts) $I =$ amount of current in the circuit (Amps) $V =$ battery voltage (Volts) 2.

Electric Circuits Review - Answers #4 - Physics
Electric charge dividing into multiple pathways in a parallel circuit is analogous to people walking down stairs which divide up into separate paths. Imagine being at a large shopping mall; you are descending a rather wide stairway when all of a

Physics Classroom Electric Circuits Answer
The flow of charge through electric circuits is discussed in detail. The variables which cause and hinder the rate of charge flow are explained and the mathematical application of electrical principles to series, parallel and combination circuits is presented.

The Physics Classroom Tutorial: Electric Circuits
Answer: See answers above. In an electric circuit, the electric potential for a moving charge is gained in the battery and lost in a light bulb (or some resistor found in the external circuit). So the electric potential of a charge is the same for any two points which are not separated by a battery or by a light bulb.

Lesson 4 Current Electricity The Physics Classroom MOP ...
An electric circuit involves the flow of charge in a complete conducting loop. When here is an electric circuit light bulbs light, motors run, and a compass needle placed near a wire in the circuit will undergo a deflection. When there is an electric circuit, a current is said to exist.
