Proximate analysis, ultimate analysis and calorific value are commonly used to characterise solid biomass fuels. The proximate analysis serves as a simple means for determining the behaviour of a solid biomass fuel when it is heated. It determines the contents of moisture, volatile matter, ash and fixed carbon of the fuel.

The proximate composition and physical characteristics of eggs from laying chickens fed diets supplemented with five different proprietary vitamin-mineral premixes (VMP) under two rearing systems (RS) in the duration of storage (DOS) were assessed. A 240 twenty week-old black Bovan nera chickens at the point of lay were randomly allotted equally to two RS in the deep litter (DL) and battery ...

3. PROXIMATE ANALYSES. The analyses included in this group, also known as Weende proximate analyses, are applied firstly to materials to be used in formulating a diet as a protein or energy source and to finished feedstuffs, as a control to check that they meet the specifications or requirements established during formulation.

The amount of gossypol present in cottonseed meal is variable and depends on the cultivar and the manufacturing procedures. In general, meals produced by the prepress solvent method are lowest in free gossypol, have greater lysine digestibility, and are the preferred meal for poultry (Phelps, 1966).

3. PROXIMATE ANALYSES

Proximate analysis is still the most widely used system for monitoring the quality of ingredients. At a time when we formulate diets based on digestible or metabolizable nutrients, its value is often questioned, since proximate components are very broad and encompass what can be both digestible and indigestible components.

ABSTRACT. In this study, the physical-chemical characteristics and proximate composition of the meat of two strains of broilers (Paraíso Pedrês and Máster gris plumé - Super Pesadão, utilized for semi-intensive rearing) and Cobb ® strain, utilized in intensive rearing systems) were evaluated. Differences related to strain and sex (males and females) were studied.
