~~Unit 7 Reaction Rates and Equilibrium Notes (answers)~~

But as product amounts increase, the rate of the reverse reaction increases. At the same time, as reactants are consumed, the rate of the forward reaction is slowing. Eventually, there comes a point at which the rate of the forward reaction exactly equals the rate of the reverse reaction. This is the point of dynamic equilibrium. The equilibrium state is dynamic, because both the forward and reverse processes are

Answer: Activation energy is the energy barrier to get to the transition state. A catalyst lowers this barrier (thereby increases reaction rate) but has absolutely no effect on the state of equilibrium. 5. Answer: k is the $Ae^{-E_a/RT}$ part of the rate law.

constant with time (the Forward Reaction Rate = Reverse Reaction Rate). - the equilibrium state is dynamic (not static). Chemical species are continuously converting from reactants to products and vice versa. It appears that the reaction has stopped only because the rate of consumption = rate of production.
