Chapter 1 Introducing renewable energy By Godfrey Boyle, Bob Everett and Gary Alexander. 1.1 Introduction Renewable energy sources, derived principally from the enormous power of the Suns radiation, are at once the most ancient and the most modern forms of energy used by humanity. Solar power, both in the form of direct solar radiation and in indirect forms such as bioenergy, water or wind power, was the energy source upon which early human societies were based.

Renewable Energy by Godfrey Boyle - Goodreads

Renewable Energy examines both the practical and economic potential of the renewable energy sources to meet this challenge. The underlying physical and technological principles behind deriving power from direct solar (solar thermal and photovoltaics), indirect solar (biomass, hydro, wind and wave) and non-solar (tidal and geothermal) energy sources are explained, within the context of their environmental impacts, their economics and their future prospects.

Ocean Energy Oceans cover most of the (70%) of the earth's surface and they generate thermal energy from the sun and produce mechanical energy from the tides and waves. The solar energy that is stored in the upper layers of the tropical ocean, if harnessed can provide electricity in large enough quantities to make it a viable energy source.
