Even in 1979 after introduction of the Z80 and 8085 processors, five manufacturers of the 8080 were selling an estimated 500,000 units per month at a price around \$3 to \$4 each. The first single-board microcomputers, such as MYCRO-1 and the dyna-micro / MMD-1 (see: Single-board computer) were based on the Intel 8080.

The 8085 processor extends the 8080 instruction set with entirely different single-byte opcodes. A good handful of the new Z-80 instructions deal with new interrupt handling modes. If you're looking to port Z-80 code to 8080 there is a relatively short list of things to watch out for:

Intel also introduced a slightly improved version of the 8080, the 8085. The standard operating system of the 8080, Z-80, and 8085 was CP/M, although several computers using these chips also had proprietary operating systems, such as Tandy's TRS-DOS. Plus, as Al Stevens graciously pointed out in his DDJ online C newsletter, BDS C may be used to produce 8080/8085/Z80 embedded systems code (it generates CP/M-resident code by default, but the runtime package can be configured easily enough to run in the absence of an operating system.)

The only reason I can think of is that Mr.Faggin somehow knew (*4) that the 8085 would as well not touch any of these opcodes, so the level of incompatibility between Z80 and 8080 would be about the same as Intel introduced with the 8085

6. INTEL 8080 VERSUS ZILOG Z80 AND INTEL 8086 6.1. Introduction. At about the same time I developed the back end for the Intel 8080 and Intel 8085, Frans van Haarlem did the same job for the Zilog z80 microprocessor. Since the z80 processor is an extension of the 8080, any machine code offered to a 8080 processor can be offered to a z80 too.

The Z80 took over from the 8080 and its offspring, the 8085, in the processor market, and became one of the most popular 8-bit CPUs. [3] [4] Zilog was later by a few years than Intel (with its 80C85) to produce a low-power CMOS CPU, and this resulted in the Intel chip first appearing in use with battery-powered portable computers, such as Tandy/Radio Shack's TRS-80 Model 100 laptop from April ...

However the Z80 with its far more capable instruction set eclipsed the 8080/8085 in personal computers. Although software like CP/M and apps mostly stuck to the 8080 subset of instructions for complete coverage. The 8085 was used in many embedded controllers. It did have the advantages of a serial interface and prioritised interrupts.
