A lazy tip is one that approves old transactions rather than recent ones. It is lazy because it does not bother keeping up to date with the newest state of the tangle, and only broadcasts its own transactions based on old data. This does not help the network, since no new

The Tangle, which is the data structure behind IOTA, is a particular kind of directed graph, which holds transactions. Each transaction is represented as a vertex in the graph. When a new transaction joins the tangle, it chooses two previous transactions to approve, adding two new edges to the

The Tangle. At the heart of IOTA is the  
Tangle, a blockchain with no blocks and

no chain! This distributed ledger technology is based on a DAG (Directed Acyclic Graph), that still functions similar to a blockchain with a P2P network and validation mechanism. IOTA merges both the user and the validator into the same entity. For every single transaction issued, a small PoW is performed to validate 2 prior transactions.

What is IOTA? A Primer on IOTA & The Tangle

A chain is a tangle where transactions only approve one previous transaction, instead of two. This happens because transactions are coming in so slowly that

at any given time there is only a single tip to approve. In the other extreme, with huge  $\lambda$ , all of the transactions arrive so fast that the only tip they see is the genesis.
