Pathological hypoxia affects both cancer cells and the tumor microenvironment, and plays a pivotal role in the process of cancer progression and dissemination. Hypoxia regulates tumor neovascularization, metabolism, cell survival, and cell death.

Although nurse practitioners have traditionally worked in primary care and specific areas of secondary care such as A&E, ... roles in cancer care. At The Royal Marsden, the role is being developed to work in the transitional care unit (TCU).

HDACs and HDAC Inhibitors in Cancer Development and Therapy

Helping cancer cells in and out of blood vessels are just some of the steps in a complex cascade of several rate-limiting ... for successful metastases, says Pollard, but in recent years it’s become clear that “macrophages enhance those rates.”

In cancer biology, autophagy plays dual roles in tumor promotion and suppression and contributes to cancer-cell development and proliferation. Some anticancer drugs can regulate autophagy.

It is becoming increasingly clear that Treg cells play an active and significant role in the progression of cancer, and... clinical strategies to diminish their regulatory influences, with the ultimate goal of augmenting antitumor immunity.

New Role of (−)-Epicatechin in Enhancing the Induction of ... FRK plays an oncogenic role in lung cancer cells via a novel regulation mechanism of enhancing the stemness of H1299 and metastasis. Our study also indicates that FRK could be used as a potential therapeutic target for drug development.

The role of hypoxia in cancer progression, angiogenesis – New front at (−)-Epicatechin in Enhancing the Induction of ... Hypoxia plays a key role in tumor progression and angiogenesis, and hypoxia-induced molecular alterations are complex.

UV radiation is an important risk factor, but cigarette smoking remains the most important cause of cancer. Radon plays a role in the risk factors of cancer, but cigarette smoking remains the most important cause of cancer.

Evidences highlight that cytokines, Toll-like receptor (TLR) signaling, and noncoding RNAs are of crucial roles in modulating antitumor immune response and cancer-related chronic inflammation, and...

Expanding the Roles of Medical Assistants: Who Does What... The current study explored the roles of ONNs in enhancing patient empowerment of adult patients with lung cancer during cancer care. With a descriptive design, this clinical function of the ONNs is for enhancing patient empowerment and self-management.

Enhancing adaptation during treatment and the role of... Based on our evidence that (−)-epicatechin (EC), an inert catechin, enhances the cancer-preventive activity of green tea, we evaluated the enhancing effects of EC on inhibition of growth conditions and apoptosis to identify any novel cancer-related outcomes.

The current study explored the roles of ONNs in enhancing patient empowerment of adult patients with lung cancer during cancer care. With a descriptive design, four clinical functions of the ONNs is for enhancing patient empowerment and self-management.
